## Pollution Prevention Guidelines

The safe operation of refuelling facilities: PPG 7 9.1 Emission reduction solutions (ERS), for example AdBlue® (summary)

If they get into the environment, ERS can seriously pollute groundwater and surface waters. It's important that they are stored, dispensed and handled correctly. ERS are soluble in water and should be kept out of surface water drainage systems that discharge to the environment. It will not be removed in an oil separator so it's important to isolate the ERS dispensing area drainage from the surface water system to reduce the possibility of spills and drips causing pollution. If this isn't possible, your site management systems should make sure any spills of ERS are cleaned up immediately with propriety sorbents.

The ideal alternative to other booms often manufactured overseas & shipped to the UK. Absorbent booms are essential in protecting our environment.

**Land booms** help reduce ground contamination & reduce the risk of harming the environment.

**Marine booms** can be deployed on ponds, streams, marinas, harbours and rivers to contain and absorb oil spills. Oil pollution can be devastating to the water environment, causing harm to animals, insects and plant life; just 1 litre of oil has the capacity to contaminate 1 million litres of water.
