Lubrication Management

## Introduction to Vickers Oils InSite Lubrication Management

**InSite** lubrication management by Vickers Oils is a web-based App that gives the end user control over his lubrication schedule, by application, individual machine or equipment, by area or production line and also by site.

Lubrication management is vital to the life of equipment and machinery to ensure that the correct lubricant is used in the correct application at the right time. This is no truer than in the food and beverage, pharmaceutical and personal care sections where the added onus on HACCP and ensuring that stringent food and pharmaceutical standards are met. Vickers Oils InSite Lubrication Management helps to ensure this is achieved.

**InSite** lubrication management starts with a detailed site survey where an experience Engineer will check every application on site. The information will be uploaded to the InSite web based App and converted into a lubrication management tool which enables the end user to completely control his weekly lubrication tasks, whether they are done every shift, daily, weekly, monthly, or any time.

Vickers **InSite** provides a daily or weekly job sheet with each application showing the lubrication required, the equipment and application to be lubricated or checked and once the engineer has completed the task, the system stores the information in the cloud, from where reports can be run to show when and by whom the task was completed, ensuring that the end user achieves their HACCP requirements for lubrication safety and helps to ensure that any internal or external audits are passed without a hitch.

The **InSite** App is then made available to the end user giving access to the Lubrication Engineers and Technicians, Maintenance Managers, Engineering Managers and Directors. Each level has different access rights.

Product Data sheets, MSDS and technical support comes with the management tool, and providing the end user is using VICKERLUBE lubricants then there is no charge for the InSite App and the full support that goes with it.
